An analytical Problem Solver obsessed with the "hidden why" in complex systems. Expert at identifying invisible patterns within large-scale data and translating them into high-impact automation tools. My approach combines technical rigor with a sharp focus on operational efficiency, ensuring every model built serves a measurable real-world purpose

Projects

CIPHER: Autonomous Multi-Agent AI Platform [↗](#)

- **Situation:** Teams building software need expertise across full stack, AI, data, security, and cloud — all at once.
- **Task:** Build the Full Stack Development agent for a 5-agent autonomous AI platform as part of a 4-member team.
- **Action:** Developed a FastAPI + CodeLlama powered agent that generates React frontends, backend APIs, and database schemas from plain English. Built the shared Streamlit dashboard used by all agents. Implemented a JSON API contract for seamless inter-agent communication and integrated an auto-routing pipeline to the security agent post code generation.
- **Result:** A fully working platform that takes one user prompt and returns secure, deployable, full stack code — autonomously, end to end.

Eye Control: Gaze-Based Mouse System [↗](#)

- **Situation:** Users with physical disabilities lacked an accessible, low-cost way to control a computer cursor .
- **Task:** Build a real-time eye-tracking system capable of translating gaze movement into accurate mouse control.
- **Action:** A gaze-based mouse control system using Python, OpenCV, and machine learning, leveraging a standard webcam as the hardware input.
- **Result:** Delivered a functional, hardware-accessible solution enabling hands-free cursor control, expanding computer accessibility for users with limited mobility.

House Price Prediction (ML)

- **Situation:** Real estate pricing is often inconsistent and manually intensive, making it hard for buyers to know a "fair" price.
- **Task:** Build an automated system to predict house prices based on historical market data.
- **Action:** Developed a Linear Regression model in Python, performing data cleaning and feature engineering on 5,000+ records.
- **Result:** Achieved high predictive accuracy, providing a data-backed tool to automate property valuation.

Customer Churn Analysis [↗](#)

- **Situation:** A subscription service was experiencing a decline in revenue due to unknown reasons for customer cancellations.
- **Task:** Analyze customer behavior to identify the root causes of "churn" (leaving the service).
- **Action:** Used Python (Pandas) to perform Exploratory Data Analysis and visualized trends across contract types and billing amounts.
- **Result:** Identified that 42.7% of month-to-month users churned due to high costs, leading to a proposed "Yearly Transition" discount strategy.

Insight Explorer: E-commerce Dashboard • [↗](#)

- **Situation:** A global retailer had over 50,000 rows of sales data but no way to see which regions or products were failing.
- **Task:** Create a real-time visual tool to track sales, profit, and shipping efficiency.
- **Action:** Cleaned raw Excel data using Power Query and built an interactive dashboard in Power BI.
- **Result:** Enabled stakeholders to spot underperforming regions instantly, streamlining the decision-making process for marketing spend.

Education

Bachelor of Engineering in Artificial Intelligence and Machine Learning

Visvesvaraya Technological University [↗](#)

Skills

Languages & Databases: Python (Pandas, NumPy, Scikit-Learn, Seaborn) , SQL (PostgreSQL, MySQL), HTML, CSS, FastAPI, Flask, Node.js, REST APIs, Docker, Git & GitHub, LangChain.

AI & Machine Learning: Linear Regression, Predictive Modeling, Natural Language Processing , Text Processing Algorithms.

Tools & Visualization: Power BI, Power Query, Excel , GitHub.

Professional Experience

Full stack Developer [Intern]

Chinivar NGO luxoft assosiated

04/2026 – 09/2026
bengaluru

Working on building and maintaining full stack web applications that support the NGO's digital operations. Responsibilities include developing responsive frontend interfaces, writing backend APIs, and collaborating with a team to ship functional, scalable solutions in a real-world professional environment.
